Question 1	1

Introduction

Here are the solutions to the past paper discussed in the revision session on 9th May 2023. This is designed as a guide to how much to write in the exam, and how you might want to style your solutions. To return to the homepage, click [here](#).

Question 1

Question.

Let $f : \mathbb{R} \rightarrow \mathbb{R}$ be given by

$$f(x) = \frac{2x^2 - 2}{x^2 + x + 2}.$$

a) Using the $\epsilon - \delta$ definition, prove that

$$\lim_{x \rightarrow 0} f(x) = -1.$$

b) Using the **Algebra of Limits** and the **Sequential Characterisation of Limits**, show that

$$\lim_{x \rightarrow \pm 1} f(x) = 0.$$

Solution. a) Fix $\epsilon > 0$ and suppose $0 < |x - 0| < \delta$ for some $\delta > 0$ to be chosen later. Then

$$\begin{aligned} |f(x) - (-1)| &= \left| \frac{2x^2 - 2}{x^2 + x + 2} - (-1) \right|, \\ &= \frac{|x||3x + 1|}{|x^2 + x + 2|}. \end{aligned}$$

Now,

$$|3x + 1| \leq 3|x| + 1 \quad (\text{by the triangle ineq.}),$$

$$< 4 \quad (\text{if } \delta < 1).$$
